

1. TITLE PAGE

LegalEase: AI-Powered Legal Document Generator

Sub-Title: Designing and Developing the User Interface

Naan Mudhalvan Project Report

Project Domain: Artificial Intelligence • Web Development • User Interface Design

Academic Year: 2026–2027

Prepared as an academic project demonstrating a modern, user-friendly interface for AI-assisted legal document drafting.

20-PAGE PROJECT REPORT

2. ABSTRACT

LegalEase is an AI-powered legal document generator designed to simplify the process of preparing structured legal document drafts. The project combines a clean web interface with an AI-assisted backend so that users can provide information through guided forms and receive an organized document draft.

This chapter of the project focuses on **Designing and Developing the User Interface**. The user interface is the main point of interaction between the user and the system. It must make complex document-generation tasks understandable, accessible, and easy to complete.

The interface is designed around clear navigation, readable typography, meaningful form fields, validation messages, document previews, and responsive layouts. The objective is to create a professional experience while keeping the workflow simple for first-time users.

3. INTRODUCTION

Legal document preparation often requires users to understand the structure of a document, identify required information, and enter that information accurately. A poorly designed interface can make even a technically capable application difficult to use.

LegalEase addresses this challenge by treating user experience as an important part of the system. Instead of presenting users with a complicated technical workflow, the application can guide them through document selection, information entry, review, and generation.

The UI therefore acts as a bridge between the user and the AI system. A well-designed interface can reduce confusion, highlight required fields, communicate errors clearly, and make the final generated document easier to understand.

4. PROBLEM STATEMENT

Many document-generation systems are difficult for ordinary users because they expose too many fields at once, use unclear terminology, provide limited feedback, or lack a logical workflow. Users may also be unsure whether their information has been entered correctly.

Problem: Design and develop a simple, responsive, and professional user interface for an AI-powered legal document generator.

UI requirements: Clear navigation, organized forms, understandable labels, responsive pages, useful feedback, accessible controls, and a clear document-result screen.

The interface should support the overall application without making unsupported claims about legal accuracy. Generated documents should be presented as drafts that may require professional review.

5. OBJECTIVES OF UI DESIGN

Primary objective: Create a user-friendly interface that makes AI-assisted legal document drafting easy to understand and operate.

Specific objectives:

- Design a clear home page explaining the purpose of LegalEase.
- Provide intuitive navigation between major sections.
- Create structured forms for collecting document information.
- Clearly distinguish required and optional fields.
- Provide immediate and understandable validation feedback.
- Design a readable document preview and result page.
- Make the interface responsive for desktop and mobile screens.
- Follow consistent spacing, typography, buttons, and visual hierarchy.

6. TARGET USERS & USER NEEDS

LegalEase can be designed for students, small organizations, entrepreneurs, administrative users, and general users who need assistance preparing structured document drafts.

User needs include: simple language, minimal unnecessary steps, visible instructions, predictable navigation, clear input fields, confirmation before generation, and easy-to-read results.

The UI should avoid assuming that users understand programming or AI terminology. Instead, technical processes should remain in the background while the interface communicates the task in practical terms.

Because legal documents can be important and sensitive, the interface should also communicate responsible use, privacy considerations, and the need to verify generated information.

7. UI DESIGN PRINCIPLES

Consistency: Use the same visual patterns for buttons, forms, headings, cards, and navigation.

Clarity: Each screen should have one obvious purpose and clear instructions.

Hierarchy: Important information should be visually prominent, while secondary information should remain less distracting.

Feedback: The system should tell users whether an action succeeded, failed, or requires correction.

Simplicity: Avoid unnecessary controls and reduce the number of decisions users must make at one time.

Accessibility: Use readable text, sufficient spacing, descriptive labels, keyboard-friendly controls, and meaningful error messages.

8. INFORMATION ARCHITECTURE

The LegalEase interface can be organized into a small number of logical sections so that users can understand the application quickly.

Suggested structure:

Home → About/How It Works → Select Document → Enter Details → Review → Generate → Document Result.

The navigation bar should provide access to the main areas without overwhelming the user. The home page can introduce the application, while the document-generation flow should focus on completing one task at a time.

This information architecture also makes the project easier to extend because additional document types can be added without redesigning the entire application.

9. HOME PAGE DESIGN

The home page is the first screen and should communicate the purpose of LegalEase within a few seconds. A strong hero section can contain the project name, a short explanation, and a primary call-to-action such as **Generate a Document**.

Supporting sections can explain how the system works, what information the user needs to provide, and what the generated output represents.

A professional home page should avoid excessive decoration. The visual design should support trust, readability, and clarity while maintaining a modern appearance.

Suggested components: navigation bar, hero section, feature cards, three-step workflow, responsible-use note, and footer.

10. DOCUMENT SELECTION SCREEN

The document selection page allows users to choose the type of document they want to generate. Each option can be presented as a card containing a title, short description, and selection button.

Examples of categories may include agreements, notices, declarations, applications, or other project-supported templates. The actual list should match the document types implemented in the application.

The selected card should have a clear visual state so users know which document type is active. Helpful descriptions can reduce uncertainty before the user proceeds.

A search or filter feature can be added if the number of document types becomes large.

11. FORM DESIGN & INPUT FIELDS

The form is one of the most important parts of the LegalEase UI. It should collect only the information necessary for the selected document and present related fields in logical groups.

Form design practices: use descriptive labels, examples or placeholders where helpful, group related fields, show required fields clearly, use appropriate input types, and avoid unnecessarily long pages.

Long forms can be divided into sections such as Personal Details, Document Details, Parties, Dates, Terms, and Additional Information.

Before submission, the interface should give users an opportunity to review their entries. This reduces avoidable errors and improves the quality of the generated draft.

12. VALIDATION & USER FEEDBACK

Good validation helps users correct mistakes without frustration. Client-side validation can provide quick feedback, while server-side validation should remain the final protection before processing.

Examples: required field missing, invalid email format, invalid date, text that is too short, or unsupported document selection.

Error messages should appear close to the relevant field and explain what needs to be corrected. Avoid vague messages such as 'Invalid input' when a more specific explanation is possible.

Success feedback is equally important. After a valid submission, the interface can show a progress indicator or confirmation before displaying the generated result.

13. DOCUMENT PREVIEW & RESULT PAGE

The result page is where the user sees the generated document draft. It should provide a clean reading experience with appropriate headings, spacing, paragraphs, and page structure.

A preview area can be accompanied by actions such as Edit Details, Regenerate, Copy, Print, or Download, depending on the features implemented.

The interface should clearly distinguish generated content from system controls. A visible responsible-use message can remind users that AI-generated legal text should be reviewed for accuracy and suitability.

Where sensitive information is handled, the design should avoid displaying unnecessary personal data in places where it could be exposed.

14. RESPONSIVE UI DESIGN

Responsive design allows LegalEase to work across desktops, laptops, tablets, and mobile devices. The layout should adapt rather than simply shrinking the desktop page.

Responsive techniques: flexible containers, responsive grids, scalable typography, stacked form fields on narrow screens, touch-friendly buttons, and mobile-friendly navigation.

Forms should remain easy to complete on small screens. Buttons should have sufficient spacing, and important actions should remain visible without excessive scrolling.

Responsive testing should be performed using different viewport sizes and, where possible, real devices.

15. UI TECHNOLOGIES & DEVELOPMENT

HTML: Provides the semantic structure of pages, forms, headings, buttons, and content.

CSS: Controls layout, spacing, typography, responsiveness, cards, buttons, colors, and visual states.

JavaScript: Can provide dynamic interactions, validation feedback, navigation behavior, and asynchronous interface updates.

Flask/Jinja: Can connect the frontend templates to backend routes and dynamically display generated results.

Python: Supports backend processing and integration with the AI/document-generation workflow.

The UI should be developed as reusable components wherever practical so that future pages can maintain the same design language.

16. UI DEVELOPMENT WORKFLOW

Step 1 – Requirement analysis: Identify users, document types, required fields, and expected outcomes.

Step 2 – Wireframing: Plan page structure before writing detailed code.

Step 3 – Visual design: Decide typography, spacing, components, layout, and responsive behavior.

Step 4 – Frontend development: Build HTML, CSS, and JavaScript components.

Step 5 – Backend integration: Connect forms and actions to the application's routes and generation logic.

Step 6 – Testing: Check usability, responsiveness, validation, and error states.

Step 7 – Refinement: Improve the interface based on observed issues and feedback.

17. TESTING & QUALITY CHECKS

UI testing ensures that users can complete the intended workflow without confusion or unexpected errors.

Functional checks: navigation links, form submission, buttons, document selection, preview, and result display.

Visual checks: spacing, alignment, typography, responsive layout, and consistent components.

Validation checks: empty fields, incorrect formats, boundary values, and unsupported selections.

Accessibility checks: readable contrast, labels for controls, keyboard navigation, focus states, and meaningful feedback.

Testing should cover both successful workflows and incorrect or incomplete user input.

18. SECURITY, PRIVACY & RESPONSIBLE DESIGN

Legal-document applications may handle personal or confidential information, so security and privacy should be considered from the beginning of UI development.

The interface should avoid exposing API keys, internal errors, or unnecessary sensitive data. Authentication and secure storage should be implemented if user accounts or document histories are introduced.

Users should understand what happens to the information they submit. The project should follow applicable privacy and data-handling requirements.

Most importantly, the UI should not imply that AI-generated content is automatically legally correct. It should communicate that generated documents are drafts and may require review by a qualified professional.

19. FUTURE ENHANCEMENTS

Future UI improvements can include a multi-step progress indicator, drag-and-drop document upload where appropriate, document history, saved drafts, multilingual Tamil/English support, dark mode, accessibility enhancements, advanced search, template categories, and personalized dashboards.

A guided assistant could explain what information is needed for each document type without replacing professional legal guidance.

Download and print controls can be enhanced with professionally formatted PDF/DOCX output. The interface can also support version comparison so users can review changes between generated drafts.

These enhancements can be introduced incrementally while preserving the same core design system.

20. CONCLUSION & VIVA SUMMARY

LegalEase demonstrates how a carefully designed user interface can make an AI-powered document-generation application easier to understand and use. The UI is not only a visual layer; it guides the user through the complete workflow from document selection to final review.

Project Title: LegalEase: AI-Powered Legal Document Generator

Sub-title: Designing and Developing the User Interface

Core UI idea: A simple, responsive, accessible interface that guides users through structured document generation.

Key technologies: HTML, CSS, JavaScript, Python, Flask/Jinja, and an AI/document-generation service where configured.

Key UI components: Home page, document selection, forms, validation, preview, result page, responsive navigation, and responsible-use information.

Final statement: LegalEase is a practical Naan Mudhalvan project that demonstrates the integration of AI, web development, and user-centered interface design to address a real-world documentation challenge.
